

Dear Music Lover

Congratulations on your purchase of the SEAS T29B001 Beryllium Dome Tweeter!

We are confident that the quality and clarity this tweeter provides will greatly enhance your enjoyment of all your favorite music recordings.

The unique beryllium diaphragm is the key ingredient to the special qualities of this tweeter. Beryllium is a metal, known for its high structural rigidity, thermal stability, and low mass, all of which makes it an excellent choice for use in a high performance loudspeaker.

Our engineers and technicians have sealed the beryllium component with a special surface-treatment to protect against any direct contact with the beryllium material under normal usage.

However, should your tweeter ever require service, extreme care must be exercised whenever handling the beryllium component, as it can be toxic should it enter the human body.

**It is therefore very important that you always observe the following safety precautions:**

- **Do NOT, under any circumstances, remove the protective grid!**
- **Do NOT attempt to open or remove any parts from the tweeter!**
- **Do NOT attempt to repair the tweeter yourself. It is not field serviceable.**
- **In case of fire, MOVE the speaker as far away from the heat source as possible!**

Please contact SEAS directly for information regarding repair or disposal of your Beryllium Dome Tweeter. You will find all necessary contact information on our website: [www.seas.no](http://www.seas.no).
